

Abstract of the Disclosure

5 A software application for creating and distributing non-sensitized
summaries from sensitized data aggregated on behalf of users is provided.
The software application comprises, a data processing portion of the
software for de-sensitizing data and incorporating the de-sensitized data into
the form of a data summary, a data caching portion of the software for
storing, managing, and serving non-sensitive data summaries and a user-
10 interface portion of the software for enabling requests for data summaries
and for enabling display of the requested summaries. A user operating the
interface portion of the software initiates a request to the data-caching
portion of the software, the request triggering service of a completed, non-
sensitive data summary or summaries created by the data processing portion
15 of the software. In preferred embodiments, the software is implemented on
cooperating nodes connected to a data-packet-network, which may be the
Internet network.
